

THE NEW PARKING EXPERIENCE

END TO END
PARKING GUIDANCE
ECOSYSTEM

PARKING | SPORT | OIL STATION | DYNAMIC INFORMATION

AGLA was founded in 1994 and, since then, immediatly became a major player in LED Signs and Variable Message Panels design and production.

Easily recognizable for their elegance, long lasting life and innovation, AGLA devices display quality in several fields, ranging from Oil&Gas to Sports, from Industrial Plants to Parking Management.

The increasing experience built over the years, together with the care for details, design and production methodology, represent the essential elements of what we call the 'AGLA way'.

The production site located nearby Milan spans over 2500 square meters and a qualified employees organization, with a network of certified partners, allows AGLA a widespread worldwide distribution of his products and services.

AGLA is UNI EN ISO 9001 certified company, which is a quality trademark.

**“Over 25 years of experience
in parking, in a single solution”**

“Realtime information
broadcasted from the city
center to the parking spot”

“Improving the parking experience
carefully integrating technology and
design into the environment”

“B2B FIRST”

From the end user, to the intermediate stakeholder, to the manager, to the service provider, the parking guidance system has been entirely redesigned based on B2B needs in order to guarantee, at any level, a boost in simplicity, performance, economy and sustainability.

AGLA PARKING ECOSYSTEM

Different needs with the same answer.

All the system elements are designed individually with the aim of being part of a whole solution, supporting users on every key moment during the parking experience.

SOFTWARE PLATFORM

The control and contact point of the AGLA system.

VARIABLE MESSAGE SIGN

An entire range of boards designed specifically by AGLA to meet the needs of the field.

VARIABLE MESSAGE ARCHITECTURAL ELEMENTS

Tailor made elements empowered by the AGLA know-how.

SENSORS & CONTROL UNITS

Elegance, reliability and performance, that's how AGLA conceives parking space monitoring.

ADVANCED SERVICES & PLUGINS

AGLA services and solutions to interface parking and its elements with the rest of the world.

SOFTWARE PLATFORM

It is the core of the AGLA parking system and provides a remote interface for the management of the parking lot, of each single device and of the information coming from it. It manages the area filling in an intelligent way based on the data collected by the sensors or retrieved from the outside world. It activates preconfigured messages or created run time based on the set scenarios. It allows the real time visualization of any information in the system and the processed statistics of the parking areas including: average parking times, occupancy percentages and customer profiling. It guarantees the accessibility of the information and the sharing with third party systems and the possibility to use them to perform actions within the physical environment.

TELLME

Web application that can be installed on ONPREMISE on a proprietary server or distributed as a CLOUD service.

The various modules have been developed to be independent and activated according to the needs of the installation. Thanks to this, the licensing package is sized according to the number and type of devices connected and can grow with the volume of the parking facility and the needs.

The provision of services allows to deliver a “turnkey” package and to ensure the appropriate support to the customer at any stage of the project life cycle.

VARIABLE MESSAGE SIGNS

The analysis and knowledge of the environment surrounding the sign.

The right balance between static and dynamic information.

The size and layout of areas and texts.

The high quality of materials and fine finishes.

The constructive accuracies and the technologies involved.

The protection systems adopted against atmospheric agents and environmental stress.

These are the guidelines that have inspired the widest range of panels created to guide the user towards the nearest and most suitable free parking space.

VARIABLE MESSAGE SIGN

MISTRAL OUTDOOR

ENTRANCE

The main goal of the MISTRAL.ENTRANCE range is to inform drivers about the presence of a parking structure and facilitate the access displaying useful information, whether static or variable. In order to accomplish at best this simple but essential function, the product must be clearly visible and easy to understand. MISTRAL.ENTRANCE, conspicuous and with its pleasant simplicity, is a business card for the parking facility.

The entire MISTRAL.ENTRANCE range is characterized by clean shapes and an extra clear tempered glass with Digital Ceramic Printing® technology which fully covers the front face. This area is completely dedicated to the presentation of static and variable information. The structural parts of the panel are made of aluminum, in order to guarantee robustness and durability. Thanks to the different models, the possible customisations and the versatility of the product, MISTRAL.ENTRANCE is able to fulfil functional, aesthetic, technical and economic needs.

SUMMARY

The main goal of MISTRAL.SUMMARY range is to summarize in a single location the information related to multiple parking lots, levels or categories of users.

The entire MISTRAL.SUMMARY range is characterized by clean shapes and a extra clear tempered glass with Digital Ceramic Printing® tecnologia which covers the front face fully. This area is completely dedicated to the presentation of static and variable information. The structural parts of the panel are made of aluminium in order to guarantee robustness and durability. MISTRAL.SUMMARY extremes the concept of synthesizing information in the full screen version where the entire area is used to report the status of the different areas, without giving space to static graphics. Alternatively, it is also used with a wider static area and customizable to meet all needs. All layouts can be composed of a few “display segments”, arranged and alternated as desired. Unused portions remain at disposal to be fulfilled by a perfectly backlit graphics.

MISTRAL.SUMMARY 700 | MISTRAL.SUMMARY 1200 | MISTRAL.SUMMARY 1550

MISTRAL.SUMMARY 700

OUTDOOR

Designed to meet the need to represent up to 4 segments of information, it allows to compose the different types of dynamic display media, still dedicating the desired space to graphics.

MISTRAL INDOOR

AREA

Shows the best direction to follow, in order to reach the nearest free parking space among the internal lanes of a parking area. This is the main purpose of the AREA range.

MISTRAL.AREA for indoor usage, in its simplicity and with all the technical and tencological features, integrates seamlessly into the parking environment, making itself discreet yet clearly visible.

The visualization of static information, as well as the versatility of the dynamic ones, allow to furnish and characterize the parking area, optimizing the internal road network and reducing management costs, pollution and number of accidents, as well as the time needed.

MISTRAL.AREA 50 | MISTRAL.AREA 100

MISTRAL.AREAIN 50

INDOOR

Small, simple and easy to install, it displays the essential information to indicate the direction to follow.

Conceived to be placed in all the junctions of the parking garage, it keeps a small satatic part that allows to personalize the graphics.

The graphic part helps the user to orient himself inside the parking by means of a chromatic, numeric or symbolic language that characterizes the structure.

VARIABLE MESSAGE ARCHITECTURAL ELEMENTS

The realization of tailor-made structures based on a given sketch or design a brand new proposal starting from a brief, are just some of the customization services provided. The company's experience and know-how are made available to the customer with the aim of installing iconic, dynamic and connected elements that integrate perfectly into the surrounding architectural context.

Mechanics, electronics and software packaged in a single complete turnkey solution.

EXAMPLES OF
VARIABLE MESSAGE
ARCHITECTURAL
ELEMENTS

SENSORS & CONTROL UNITS

Sensors and control units that address the needs of all stakeholders throughout the entire product lifecycle. The needs of the buyer, the installer, the maintainer, the manager and the end user, in addition to the physical positioning and the environment surrounding the product, are the basis for the design. The choice of raw materials and technologies to be adopted, in addition to the study of shapes and positioning, allow the creation of products that are functional, decorative and allow to obtain maximum performance from any point of view.

APEYE

All-in-one ultrasonic sensor with innovative design and amazing intuition. Product covered by patent as the first in the category of ultrasonic sensors to be able to monitor and report the occupational status of the car from 45° with a single device. Positioned above the line of each parking space is connected to a concentrator, located in strategic areas, able to power and coordinate the readings of the region. Designed, manufactured and supplied to facilitate all phases from engineering, installation and activation, can reduce the costs of plant accessories and maintenance.

APEYE.SENSOR

APEYE.SENSOR

The main server is connected to the zone concentrators and allows access to clients on the same network.

The zone concentrators control up to a maximum of 64+64 sensors, synchronizing the readings and sharing the information received from the sensors to the central server.

The sensors, equipped with 3 ultrasonic emitters at 44KHz and a receiver, monitor the parking space and display their status through RGB leds.

FIXING

Heigh: min 2100 mm max 300

CONNECTION

ARCHITECTURE

CONCENTRATOR

OPTIONAL SERVICES

CICLOPEYE

This device exploits the most innovative technologies and the latest Machine Learning algorithms based on Neural Networks, to perform real time video analysis on-board.

Designed to simplify the system architecture, reduces the number of single points of failure and maximizes the performance of occupational status detection, it adds the ability to recognize objects and perform advanced functions thanks to image reconition.

A single device, positioned in the center of the lane, is able to monitor and read the license plates of up to 3+3 cars. The indicator lights report the availability of parking spaces on one side or the other of the lane through powerful RGB LEDs.

CICLOPEYE.CONCENTRATOR | CICLOPEYE.SENSOR

CICLOPEYE

Each sensor is connected to a zone POE switch through a simple ethernet cable.

The zone switch is responsible for powering the device and for putting the devices in communication, through a star network, with the central server.

Each individual device communicates with the server to synchronize it with the information detected on each monitored parking space.

The transmission of only metadata between the sensor and the server ensures maximum privacy and the simplest architecture to support the system.

FIXING

Heigh: min 2100 mm max 300

BRACKET:

ARCHITECTURE

CONCENTRATOR

ADD-ON

OPTIONAL SERVICES

PARKIO

Control board produced to electronically interface different physical devices located in the parking facility.

Capable of detecting signals or implementing physical commands, it communicates directly with the central server.

Programmable and configurable according to need, it performs a wide range of tasks, from counting cars by means of connected loop or photocell systems, to the activation of ventilation systems or the opening of parking barriers.

SMART LIGHTING

An intelligent lighting system and not just a simple lamp, devices interconnected with the parking guidance system, able to ensure true energy efficiency. To effectively illuminate an area, it is necessary to know the normative that regulate the required lighting levels, the architectural peculiarities and the design of a lamp integrated in the environment.

A technologically advanced lamp with an elegant and functional design is AGLA's solution to complete the parking guidance system, which aims to accompany the user to the end of his parking experience, illuminating his path in the best possible way.

MYRA.LIGHT

Made in Italy by AGLA, the MYRA lighting system is a synonym of quality and resource efficiency. Positioned in the center of the driving lane, each MYRA.LIGHT is able to cover an area of 7,5x16 meters with only 80W. Thanks to its smart driver each lamp is able to self-adjust according to the external light, compensating only the light needed to reach the desired threshold. In addition, the lamp guarantees 5 years of constant flow of lighting going to compensate for the physiological loss of efficiency of the LED over time by increasing consumption until it reaches the nominal power.

MYRA.LIGHT PK | MYRA.LIGHT XL

MYRA.LIGHT PK

REFERENCE FLUX 8.250 lm
CONSTANT FLUX 0-60.000 h 7.160 lm
covered area: 7,5x16m

Thanks to the asymmetrical lenses, MYRA.LIGHT PK conveys all the energy of the LEDs in the directions where light is needed, maximizing the ratio light emitted over consumption.

MYRA.LIGHT XL

REFERENCE FLUX 8.910 lm
CONSTANT FLUX 0-60.000 h 7.740 lm
covered area: 7,5x7,5m

To smoothly cover lanes and certain areas of the parking structure, MYRA.LIGHT XL is designed to fit all situations, avoiding glare to drivers but maximizing efficiency.

LENSES

Silicone is rich in remarkable features and one of the main for this applications is the resistance to Hydrocarbon (high presence in covered parking areas), which represents the main cause of yellowing of the plastic materials. Combined with high temperature resistance, these features of the lenses drive to a high transparency of 94%, compared with 92% of the glass and 87-88% of PMMA (Polymethyl-methacrylate). Moreover, since also the primary lens of LEDs is made of silicone, improves the LED-lens pairing and thus efficiency.

ADVANCED SERVICES & PLUGINS

A modern parking guidance system needs to be integrated into the environment, but also with the users. The interconnection of systems and the exchange of information between different services and service providers are aimed at sharing as much information as possible. AGLA has an OPEN DATA SYSTEM where the sharing of information is the basis of future evolution.

API

At the base of the data exchange between software systems there are the well-known Application Programming Interfaces, a set of definitions and protocols for the creation and integration of application software.

AGLA parking guidance system uses and provides APIs to interface with and be interfaced with third party systems. From the highest and most advanced software layers, to the lowest and most interconnected devices, the solution can be easily integrated with the external environment.

FIND YOUR CAR

The find-your-car is the service that allows the user to easily locate his car within a parking area. Improperly, this service is thought to be provided by the video sensor. In the reality the video sensor is the technology needed to collect the data of the vehicle license plate. It is the whole system of driving to the place that allows you to use it by accessing the data as a service.
